Shoulder Arthroplasty

Goals and Objectives

Course Description

"Shoulder Arthroplasty is an online recorded video of a previously presented live CE webinar for physical therapists and physical therapist assistants that examines surgical management of shoulder pathology through joint arthroplasty. This course includes a review of current literature relating to shoulder pathophysiology, arthrokinematics, arthroplasty procedures, and post-surgical care.

Course Rationale

The purpose of this course is to provide physical therapy professionals with contemporary information about degenerative shoulder pathophysiology, arthroplasty procedures, post-operative arthrokinematics, precautions, and potential complications.

Course Goals and Objectives

Upon completion of this course, participants will be able to:

- 1. List and identify all common orthopedic structures of the shoulder girdle.
- 2. Recognize and define common degenerative and traumatic shoulder pathologies.
- 3. Define normal and pathologic shoulder arthrokinematics
- 4. Identify the three most common shoulder arthroplasty surgical procedures.
- 5. Identify possible post-surgical complications following shoulder arthroplasty.
- Recognize anatomical and post-arthroplasty shoulder kinematics.
- 7. Identify expected functional outcomes following shoulder arthroplasty.
- 8. Identify post-operative precautions

Course Provider - Innovative Educational Services

Provider Contact Information - information@cheapceus.com

Course Instructor - Jodi Gootkin, PT, Med, CEAS

Financial/Non-financial Disclosure - Neither the Provider nor the instructor have any financial or non-financial conflict of interest related to the presentation of this CE program.

Target Audience - Physical Therapists, Physical Therapist Assistants

Course Educational Level - This course is applicable for introductory learners.

Course Prerequisites - None

Instructional Method – Distance Learning – Independent; Asynchronous online video-based home study

Location - Cheapceus.com

Date - Continuously available on-demand

PD Activity Completion Requirements / Criteria for Issuance of CE Credits – Completion of viewing of 1 hour recorded video, and a score of 70% correct or greater on the course post-test.

Continuing Education Credits - Three (3) contact hours

Course Fee - \$34.95

Registration Information – No pre-registration required; available on-demand at Cheapceus.com

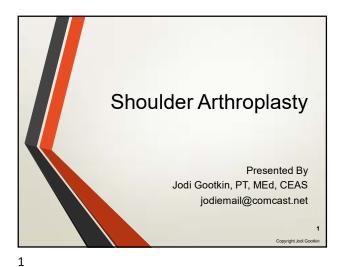

Special Needs Requests - Email: information@cheapceus.com or phone: 954-663-4101

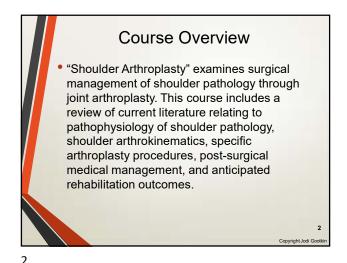

Cancellation by the Learner - Learners may cancel their participation at any time and receive a full refund of all paid fees.

Cancellation by the Provider – Registrants for the cancelled activity will be contacted by an IES staff member via phone call or email within 12 hours of the cancellation decision. If the decision to cancel is made less than 14 hours prior to the event, each participant will be contacted no later than 2 hours prior to the scheduled start time of the activity. Registrants will receive a full refund if an activity is cancelled by the Provider. The refund will be processed back to the Registrant within 12 hours of the cancellation.

Complaint Resolution – Please call 954-663-4101 (24 hours/day, 7 days/week) to speak with a live customer service agent. Our goal is to work with our customers to resolve all issues to the customer's satisfaction with just one phone call whenever possible.

Refund Policy - Unrestricted 100% refund upon request. The request for a refund by the learner shall be honored in full without penalty or other consideration of any kind. The request for a refund may be made by the learner at any time without limitations before, during, or after course participation.

Course Rationale

• The purpose of this course is to provide a comparative analysis of surgical techniques and post-surgical management to understand current prosthetic advances, rehabilitation considerations and maximize outcomes based on current research.

Goals and Objectives List and identify all common orthopedic structures of the shoulder airdle. Recognize and define common degenerative and traumatic shoulder pathologies. Define normal and pathologic shoulder arthrokinematics Identify current surgical and non-surgical management strategies for treating shoulder arthropathy Compare and contrast the three most common shoulder arthroplasty surgical procedures. Identify post-surgical complications following shoulder arthroplasty. Compare anatomical and post-arthroplasty shoulder kinematics. Identify the primary goals of post-surgical patient management. Detail factors associated with improved outcomes following total joint replacement 10. Outline the components of a comprehensive rehabilitation program following shoulder arthroplasty.

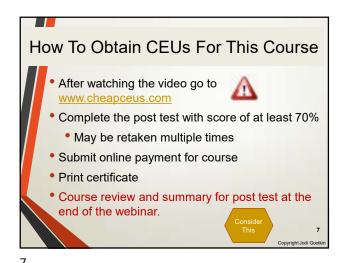

Disclaimer

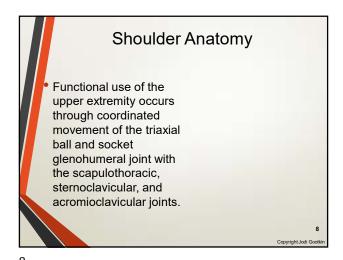

• Application of concepts presented in this webinar is at the discretion of the individual participant in accordance with federal, state, and professional regulations.

Infraspinatus

Teres Minor

Subscapularis
"biphasic muscle"

Deltoids

Complete and

Convex-Concave Rule Normal arthrokinematics of the shoulder follow the convex on concave rule. With open chain motions, the convex humeral head moves against the concave glenoid surface with roll and glide occurring in opposite directions. Abduction Superior Inferior Flexion (Anterior Elevation) Anterior Posterior Internal Rotation Posterior Anterior External Rotation Posterior Anterior

Compressive and Shear Forces
The articular surface area of the humeral head is approximately three times greater than that of the glenoid fossa requiring the joint to rely on surrounding soft tissue structures for stability.

Compressive Force
Subluxation Risk Joint Loading
Shear Force
Consider This

Shoulder Arthrokinematics

The rotator cuff provides inherent joint stability through compression of the humeral head against the glenoid fossa.

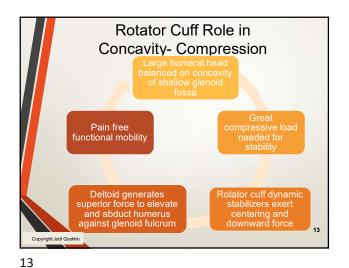

The cuff muscles function as a force couple creating dynamic stabilization so the deltoid can elevate and abduct the shoulder with the glenoid acting as a fulcrum.

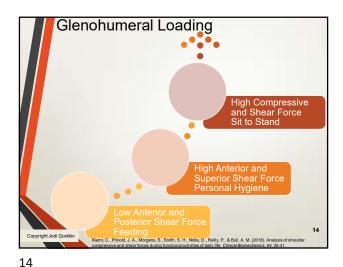

Shoulder Arthroplasty

9

12

10

Shoulder Pathology Common Diagnoses Managed with Shoulder Arthroplasty Degenerative Shoulder Conditions **Rotator Cuff** Arthropathy Proximal Primary Irreparable

Osteoarthritis Rotator Cuff Humerus Fractures Post Traumatic Tear Avascular Necrosis

Traumatic Shoulder Pathology Complications from complex proximal humerus fracture include non-union or displacement of tuberosities and their tendinous insertions. In cases at risk for avascular necrosis or where Open Reduction Internal Fixation (ORIF) cannot achieve stable alignment, hemiarthroplasty or arthroplasty may be utilized.

15

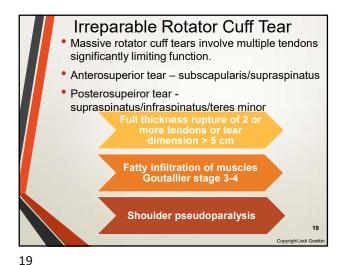

Degenerative Shoulder Pathology Osteoarthritis As osteoarthritis progresses significant glenoid bone loss and deterioration of the rotator cuff contribute to additional pain and disability. Patients undergoing Total Shoulder Arthroplasty appear to have improved functional and pain scores compared to hemiarthroplasty. Reverse Shoulder Arthroplasty may be selected if extensive posterior erosion of the glenoid fossa is present.

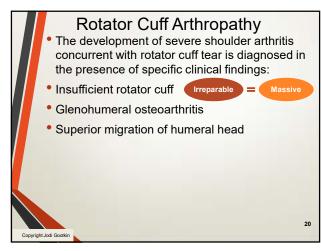

Degenerative Shoulder Pathology Rheumatoid Arthritis Several reviews do not support shoulder arthroplasty for patients with rheumatoid arthritis at this time. Chronic inflammatory synovitis resulting in poor bone stock, osteopenia, and diminished soft tissue integrity restricts range of motion improvements post operatively.

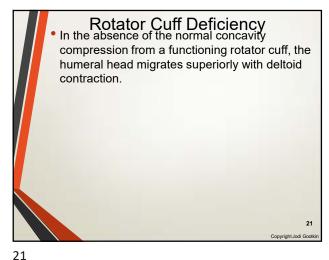

Shoulder Arthroplasty

18

16

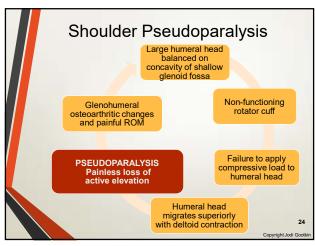

Pseudojoint Formation Humeral impingement against the acromion leads to degenerative changes referred to as "acetabularization" of the under surface of the acromion and "femoralization" of the humeral head. 22

33

36

34

Reverse Shoulder Prosthesis

Glenohumeral articulation is inverted with the convex prosthesis attached to glenoid fossa and the concave component attached to humerus.

The glenosphere is attached to a baseplate secured into the fossa by a large central peg and cortical screws.

The humeral component is a cup shaped body attached to a metal stem that is press fitted or cemented into the humeral medullary canal.

A polyethylene liner articulates the two components.

Humeral Component Fixation

- Acromial fractures
- Infection
- Nerve injury
- Thromboembolism

- Early humeral stem migration
- Non-progressive radiolucent lines

- Functional outcomes and range of motion equivalent with both uncemented and cemented RSA stems.

39

Constrained Design

The constrained mechanical design of the prosthesis provides joint stability with extremity motion in the absence of a functioning rotator cuff.

The fixed center of humeral rotation is moved distal and medial in relation to glenoid surface.

Converts shear to compressive force

Fixed Fulcrum

Creates fixed fulcrum at the glenoid for the humerus to rotate against allowing the deltoid to elevate the arm without impingement.

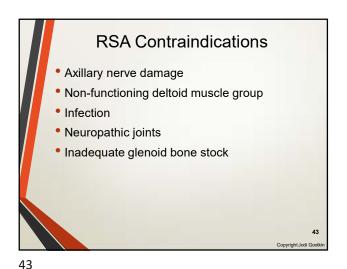

Lengthening of the humerus in relation to the scapula enhances the moment arm of the deltoid to perform forward elevation and abduction.

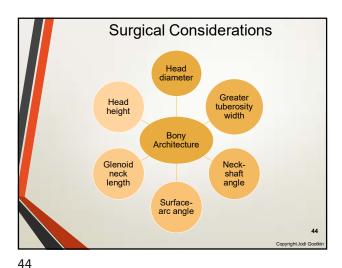

Prosthetic design allows arm elevation in the absence of a fully functioning rotator cuff.

Shoulder Arthroplasty

42

40

Neck-Shaft Angle

• Alteration of the angle between the humeral head and neck in the prosthetic design influences stability of the joint post operatively.

• Humeral component design creates a neck-shaft angle of 135 degrees.

Increasing the angle to

155 degrees demonstrates higher instability rates of the new joint.

kin .

Male vs. Female Shoulder Anatomy

• Surgical alteration of shoulder articular surfaces by 4-5 mm compared to the native joint can significantly impact kinematics of the joint.

Men

• Greater head diameter, glenoid neck length, and greater tuberosity width

Women

• Greater radius of curvature

45

Deltoid Tensioning

• Significant pre-operative deltoid atrophy is associated with diminished functional achievements post surgery.

Insufficient Tension = Joint Instability

Over tensioning = Acromion Fracture

Component Fixation

• Limited bone stock may present a challenge to achieving fixation of glenoid component.

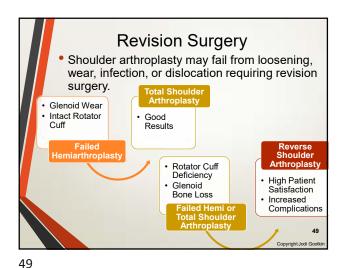

• Locking screws with multi-axial designs and hydroxyapatite coatings aid in improving fixation.

• Some surgeons prefer impaction grafting with a humeral press fit component to reduce fracture risk.

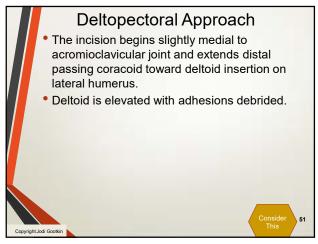

Shoulder Arthroplasty

48

46

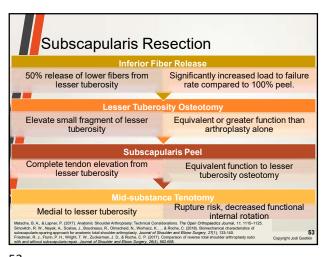

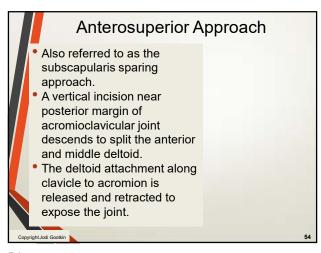

Caution is taken to avoid injury to axillary nerve, musculocutaneous nerve and anterior circumflex vessels.
The subscapularis must be resected to gain access to glenohumeral joint.

Shoulder Arthroplasty

51

54

52

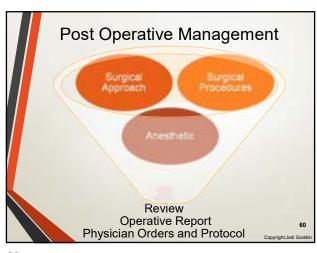

Long Head of Biceps Tendon(LHBT) Tenodesis LHBT tenodesis is indicated in patients with chronic atrophic changes, tendon rupture, and routinely performed by some surgeons in absence of obvious tendonopathy. Tenodesis is performed with resection of the proximal tendon and resuturing to the insertion of the pectoralis major near the intertubecular grove.

Acute Post Surgical Under 55 Management years old, demand increase 8% As future demand per year increases, management of perioperative factors Over 55 years, that influence hospital old demand increase 12% length of stay can per year increase discharge disposition to home, 2030, younge patients improve functional account for outcomes, and manage 4% of arthroplasties health care costs.

57

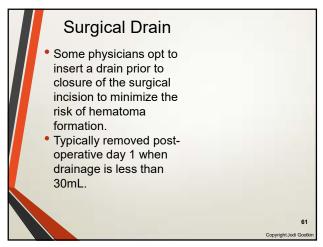

Patient education Preoperative education should focus on pain self-management, activities of daily living training, donning/doffing sling, and mobility in addition to patient expectations of recovery.

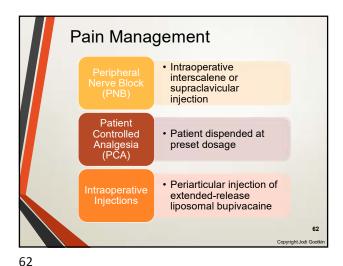

Shoulder Arthroplasty

Recurrent Laryngeal Nerve Block
• Hoarseness

Diaphragmatic Hemiparesis
• Decreased Respiratory Capacity

Hand Motor Block
• Decreased Grip Strength

Tobacco Use and Pain Management

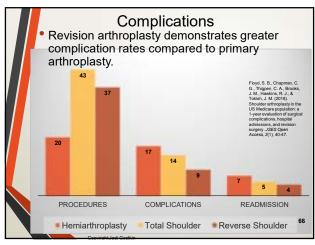

Current tobacco use is associated with a more challenging post-operative course.

Higher perceived pain scores
Greater narcotic pain medication consumption
Slightly longer hospital length of stay

Wels D. B. Holt, A. M. Smith, R. A. Broth, T. J. Azar, F. M. 8. Throdemotor, T. W. (2018). Tobacco use predicts a more difficult episode of care after anistoric total shoulder arthroplasty. Journal of shoulder and ellows surgery, 27(1), 23-28.

Breathing Exercises

In addition to reducing the risk of atelectasis and pneumonia, breathing exercises emphasizing postural alignment can assist in reducing protective muscle spasms.

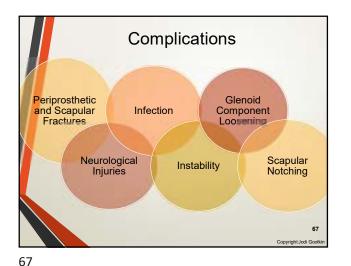

Shoulder Arthroplasty

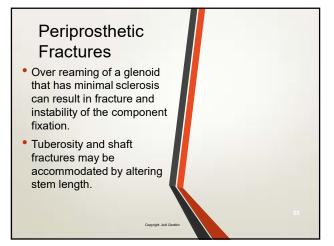

61

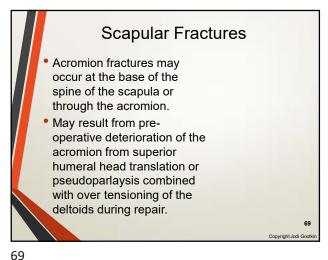

63

66

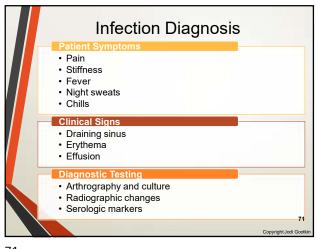

64

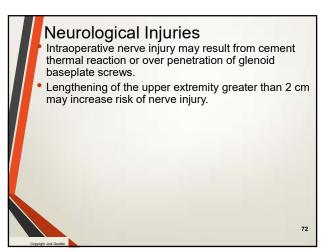

Infection Higher infection rates occur with the RSA potentially due to greater unoccupied joint space post prosthetic implant. Common pathogens are Propionobacterium acnes and Staphylococcus. Increased incidence of infections in patients with rheumatoid arthritis, diabetes mellitus, history of oral steroid use, shoulder trauma, smoking or failed shoulder hemiarthroplasty.

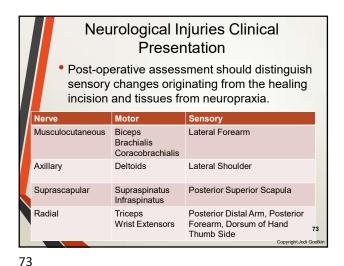

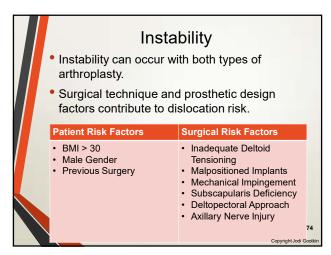

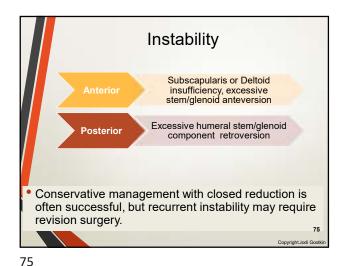

Shoulder Arthroplasty

Subscapularis Sparing Approach Earlier Weaning for ROM

ToolyrightJoid Gootkin

Shoulder Arthroplasty

78

Glenoid Component Loosening

Loosening of the glenoid component is the most common long term complication associated with TSA as a consequence of the unconstrained design combined with a deficient rotator cuff.

The shallow glenoid migrates and loosens against the unopposed force of the deltoid contraction.

Additional contributing factors:

Eroded or medialized glenoid

Component malposition that increases stress forces

Excessive reaming reducing bone stock

Underlying infection

Rotator cuff tear

Instability

Rocking Horse Phenomena

In the TSA, with shoulder flexion and abduction the point of contact of the humeral head in the glenoid fossa shifts superiorly.

Without accurate glenoid prosthetic orientation and sufficient rotator cuff strength the glenoid baseplate undergoes eccentric loading.

Aseptic Loosening

• Poor implant alignment, rotator cuff dysfunction, and humeral head instability contribute to loosening.

Edge loading "rocking horse"

Polyethylene wear

Osteolysis

Aseptic loosening

Prosthetic failure

Scapular Notching
Over time following RSA, humeral component impingement causes erosion of the inferior scapular neck.

81

84

82

Post Operative Arthrokinematics

• The goal of reconstruction is to replicate normal articular anatomy restoring soft tissue length tension relationships, kinematics, and function.

Kinematic Analysis of Motion

• Scapulohumeral rhythm is typically reduced with the overall scapular kinematic pattern preserved.

• The patient may substitute with increased scapular motion to compensate for decreased glenohumeral mobility for the performance of activities of daily living.

87

Range of Motion Expectations

• Full ROM is NOT expected upon discharge from rehabilitation.

• Upon discharge from therapy most patients achieve approximately 80-120 degrees flexion and 30 degrees external rotation.

130

Future of Shoulder Arthroplasty

• Enhancing design of the reverse shoulder components to restore greater external rotation is expected to improve functional outcomes.

• Monitoring long term implications of scapular notching on prosthetic survival is needed.

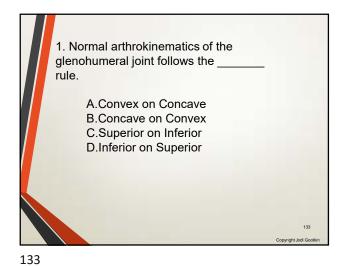

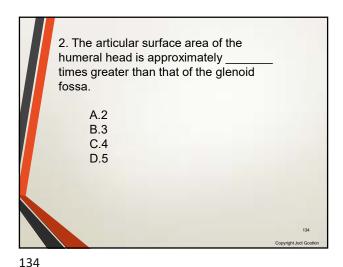

Shoulder Arthroplasty

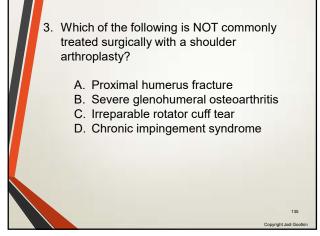

127

129

132

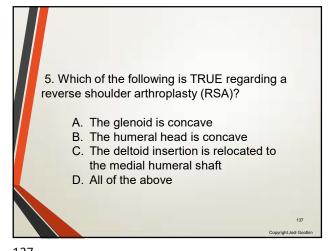

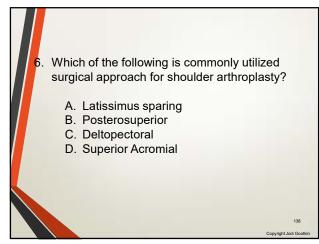

4. Which anatomical structure is replaced in a shoulder hemiarthroplasty?

A. Humeral head
B. Glenoid fossa
C. Acromial-clavicular joint
D. Coracoid process

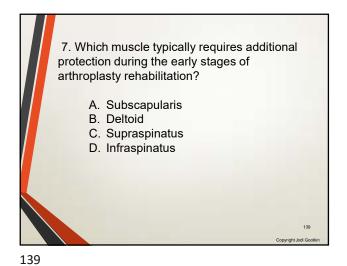

135

Shoulder Arthroplasty

138

8. What is the most common long-term complication associated with anatomic total shoulder arthroplasty (TSA)?

A. Humeral shaft fracture
B. Supraspinatus avulsion
C. Radial nerve neuropathy
D. Loosening of the glenoid component

140

9. Approximately, how much functional AROM should a patient have at therapeutic discharge?

A. 30-60 degrees flexion; 15 degrees ER
B. 60-90 degrees flexion; 30 degrees ER
C. 80-120 degrees flexion; 30 degrees ER
D. 120-150 degrees flexion; 60 degrees ER

10. Which surgical intervention generally produces superior functional outcomes as it relates to return to sport?

A. Hemiarthroplasty
B. Total Shoulder Arthroplasty (TSA)
C. Reverse Shoulder Arthroplasty (RSA)
D. Outcomes for all are equal
