Distal Upper Extremity Surgical Management Goals and Objectives

Course Description

"Distal Upper Extremity Surgical Management" is an online recorded video of a previously presented live CE webinar for rehabilitation professionals that examines surgical procedures to manage common orthopedic pathologies of the distal upper extremity. This course includes a review of current literature relating to surgical procedures for nerves, tendons, ligaments, and bones of the forearm, wrist and hand.

Course Rationale

The purpose of this course is to provide an understanding of the current trends in surgical procedures to manage degenerative, traumatic and nontraumatic pathologies of forearm, wrist, and hand. The emphasis is comparative analysis of contemporary surgical techniques to restore distal upper extremity function through repair of nerves, tendons, ligaments, and bones.

Course Goals and Objectives

Upon completion of this course, participants will be able to:

- 1. List and identify common anatomical structures of the wrist and hand.
- 2. Distinguish neuropathy, degenerative, traumatic, and non-traumatic distal upper extremity pathologies.
- 3. Identify emerging surgical techniques for distal upper extremity pathologies.
- 4. Compare nerve decompression, nerve repair, and nerve transfer surgical procedures.
- 5. Identify the zones of flexor tendon repair and surgical repair techniques.
- 6. Identify fascia surgical techniques to manage conditions of the wrist and hand.
- 7. List surgical mechanisms of stabilization of forearm and carpal fractures.
- 8. Identify post-surgical complications during healing of distal upper extremity fractures.
- 9. Recognize common arthroplasty surgical techniques for the wrist and hand.

Course Provider - Innovative Educational Services

Provider Contact Information - information@cheapceus.com

Course Instructor – Jodi Gootkin, PT, Med, CEAS

Financial/Non-financial Disclosure - Neither the Provider nor the instructor have any financial or non-financial conflict of interest related to the presentation of this CE program.

Target Audience - Occupational Therapists, Occupational Therapy Assistants

OT Scope of Practice - Foundational Knowledge

Course Educational Level - This course is applicable for introductory learners.

Course Prerequisites - None

Instructional Method - Distance Learning - Independent; Asynchronous online video-based home study

Location - Cheapceus.com

Date - Continuously available on-demand

PD Activity Completion Requirements / Criteria for Issuance of CE Credits – Completion of viewing of 3 hour recorded video, and a score of 70% correct or greater on the course post-test.

Continuing Education Credits - Three (3) contact hours / .3 AOTA CEUs

Course Fee - \$34.95

Registration Information - No pre-registration required; available on-demand at Cheapceus.com

Special Needs Requests - Email: information@cheapceus.com or phone: 954-663-4101

Cancellation by the Learner – Learners may cancel their participation at any time and receive a full refund of all paid fees.

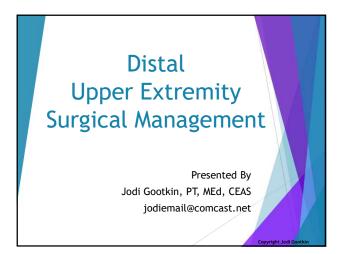

Cancellation by the Provider – Registrants for the cancelled activity will be contacted by an IES staff member via phone call or email within 12 hours of the cancellation decision. If the decision to cancel is made less than 14 hours prior to the event, each participant will be contacted no later than 2 hours prior to the scheduled start time of the activity. Registrants will receive a full refund if an activity is cancelled by the Provider. The refund will be processed back to the Registrant within 12 hours of the cancellation.

Complaint Resolution - Please call 954-663-4101 (24 hours/day, 7 days/week) to speak with a live customer service agent. Our goal is to work with our customers to resolve all issues to the customer's satisfaction with just one phone call whenever possible.

Refund Policy - Unrestricted 100% refund upon request. The request for a refund by the learner shall be honored in full without penalty or other consideration of any kind. The request for a refund may be made by the learner at any time without limitations before, during, or after course participation.

Innovative Educational Services is an AOTA Approved Provider of professional development. PD activity approval ID# 5471. This Distance Learning – Independent PD activity is offered at .3 CEUs; Introductory; OT Foundational Knowledge. The assignment of AOTA CEUs does not imply endorsement of specific course content, products, or clinical procedures by AOTA.

Course Overview

"Distal Upper Extremity Surgical Management" examines surgical procedures to manage common orthopedic and neurologic pathologies of the distal upper extremity. This course includes a review of current literature relating to surgical procedures for nerves, tendons, ligaments, and bones of the forearm, wrist and hand.

2

Course Rationale

The purpose of this course is to provide an understanding of the current trends in surgical procedures to manage degenerative, traumatic and non-traumatic pathologies of forearm, wrist, and hand. The emphasis is comparative analysis of contemporary surgical techniques to restore distal upper extremity function through repair of nerves, tendons, ligaments, and bones.

3

1

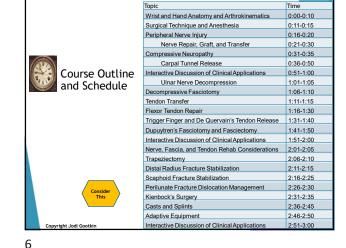

Goals and Objectives

- List and identify common anatomical structures of the wrist and hand.
- 2. Distinguish neuropathy, degenerative, traumatic, and nontraumatic distal upper extremity pathologies.
- Identify emerging surgical techniques for distal upper extremity pathologies.
- Compare nerve decompression, nerve repair, nerve graft, and nerve transfer surgical procedures.
- Identify the zones of flexor tendon repair and surgical repair techniques.
- Describe fascia surgical techniques to manage conditions of the wrist and hand.
- 7. List surgical mechanisms of stabilization of forearm and carpal fractures.
- 8. Identify post-surgical complications during healing of distal upper extremity fractures.
- Describe the surgical technique to manage thumb osteoarthritis.
- Recognize common hand splints indicated to manage wrist and hand disorders.

4

16

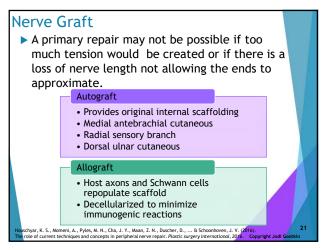

Nerve Repair

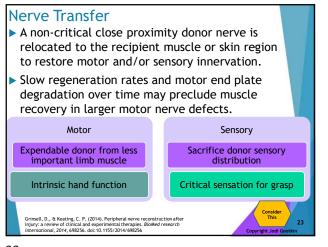

- Sharp lacerations can sever nerves requiring fascicular matching of the proximal and distal segments.
- Direct repair is performed with end-to-end epineural microsutures.
- Caution is taken when approximating the nerve to avoid strangulated or loose nerve ends of the coaptation.

Rinker, B. D. (2018). Nerve Repair Manual: A Practical Approach to Injuries and Repair in the Brachial Plexus and Upper Extremity. Annals of Indexts Surgers, 80(1), e1

22

Neuroma Complication

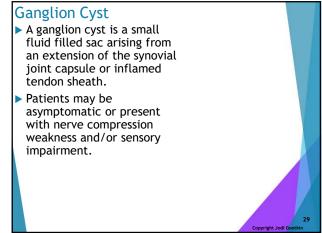

- Neuroma formation during healing can lead to sensory loss, neuropathic pain, or the need for revision surgery.
- The inflammatory reaction during healing and increased concentration of nerve growth factor leads to connective tissue hyperplasia.

25

27

Distal Upper Extremity Surgical Management

cyst reforming.

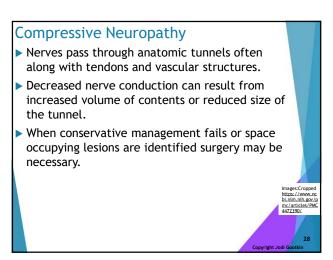

Immobilization without tensioning the nerve site followed by gradual mobilization to prevent joint contracture.

Hyperesthesia during healing is a positive indicator of regeneration.

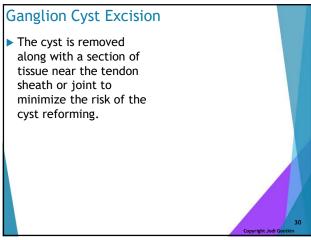

Nerve Repair, Grafting, Transfer Rehab

- In pediatrics manifests as biting
- Patient education on safety particularly related to hot and cold sensation.
- Alternating current electrical stimulation can be initiated once volitional twitch contraction is evident.

26

28

30

Carpal Tunnel Syndrome

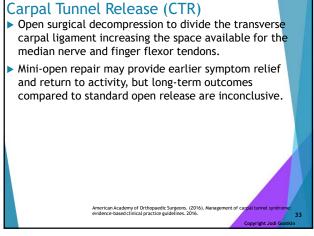

- Entrapment of the median nerve occurs beneath the flexor retinaculum of the wrist resulting in weakness.
- Motor weakness of the hand intrinsics and thenar muscles limits grasp and pinch.
- Sensory impairment involves the palmar surface and dorsal nail bed of the thumb, index, middle, and radial side of ring finger.
- Surgery is indicated when conservative management fails to relieve persistent numbness and thenar wasting is evident.

31

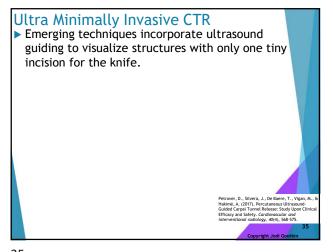

Carpal Tunnel Anatomy

- Tendons of the flexor digitorum profundus and superficialis along with the median nerve are encased in a synovial membrane.
- Subsynovial connective tissue is layered within the tunnel to minimize shear stress with hand motion.

Perilunate Post-op

- Approximately 2 weeks following surgery, the post operative splint is replaced with a short arm cast then weaned to a removable splint.
- Monitor for median nerve palsy, fracture nonunion, and Kienbock's Disease.
- Despite early management many patients experience long term stiffness, weakness, osteoarthritis, in latent carpal instability.

105

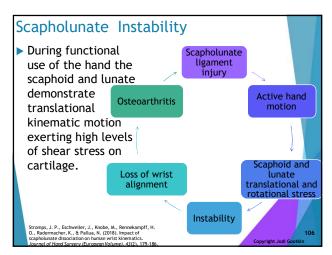

107

Distal Upper Extremity Surgical Management

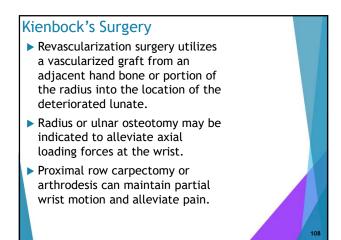

Perilunate Management

- Closed reduction of the carpus followed by direct primary fracture stabilization with K-wire placement and ligament repair.
- When fracture stabilization and open reduction are unsuccessful carpectomy and arthrodesis are necessary.

104

106

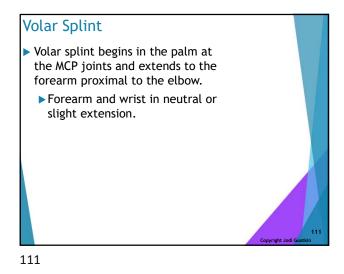

108

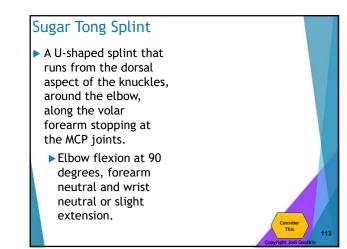

Casts and Splints

- Casts may be utilized to rigidly stabilize surgical repair sites.
- Splints utilized for post operative stabilization allow some expandability to accommodate swelling and visualization of the wound.
- Splints wearing schedule can be modified protect the wrist and hand as the patient regains functional use of the hand.
